- How did you find the bugs that you found?

In the Enter Wanted exercise, I tried to submit a valid input following the guidelines that were provided and fixed them based on the error message I received. Because of that, I discovered where each of the bugs were and documented them.

In the Yoodlize exercise, I was unable to select the stars to see the reviews. So, we saw that as something a user would naturally do and might be frustrated when it doesn't work. We put it in to be fixed.

- **Compare your tests to your classmates**
 - Are your tests more broad or specific?

Most of our tests were pretty specific but we had a few that were a bit more broad.

- What are the pros and cons of specific test steps?

Pros:

- You can test every function of the website.
- You can verify that the website is functioning as intended.
- Testing specific items refines the user experience

Cons:

- More difficult to see bugs if you don't know exactly what the function should be.
- More difficult to ensure that the bug you see is caused alone and not causing other bugs

- What are the pros and cons of broad test steps?

Pros:

- Open to user interpretation which will reveal bugs the creator may not have thought about.
- Creates less confusion because it is so simple
- Allow non-tech users to explore and find bugs you may not see

Cons:

- Without specific user directions, you may miss paths that you need to check for bugs
- Less refined or polished
